

Abstract of the Disclosure:

In a connector including a housing and a contact held in the housing for being brought into contact with a connection object, the contact includes a contacting portion surrounded by a wall portion to which a locking portion connected. The housing has a displaceable housing lance. The wall portion has first and second side walls faced to each other with a space left therebetween. The locking portion extends from the first wide wall towards the second side wall and has an extending end. The second side wall has a locking/holding portion holding the extending end. Thus, the locking portion is adapted to be engaged with the housing lance.
